Conclusion

<1 min

While it is true that AI creates a number of serious issues, there are several ways we can ensure we remain safe. By carefully reviewing the information presented to us, we can, with a high degree of confidence, detect and respond to AI material appropriately.

In many cases, the issues presented by AI are not necessarily new. Misinformation has been around since humans began sharing ideas, fake images have been around since Photoshop, and fake audio, while primitive and unnerving, has been around since people could record voices. While AI has made improvements in speed, quantity, or quality to exasperate these issues, there are many basic steps we can take as individuals to combat these creations.

Basic fact-checking, careful review, and deep thought can help us detect many scams and ploys created by malicious users leveraging AI. Additionally, given the increased threat, many organizations and researchers have begun to develop solutions to detect and warn us about potential risks more effectively.
